

1. Executive Summary

-Primary Value Propositions:

- You could generate quotes as you estimate instead of estimating and then generating a quote. This simplifies the estimating-quote building process from something that could be an hour-plus long with multiple steps to something more streamlined that could be done in 10-15 minutes at most
- Modernizing the estimating and quote building workflow with better UI and AI.: Let's just say you put in the scope of work and boom it gives you a V1 quote you could conversation with the AI based off the context in that "for example you could be like all right now add a 9% sales tax instead of 10 or let's add 5% discount to these following line items ABC. And boom it will update and provide a new version of that quote. The goal is that the user could chat in natural language. and as they're typing in submitting, they'll see on the right hand side, what their quote is gonna look like. It should use LLM's to par the inputs.
- Easily upload new products and keep track of your price book to understand margins of each product you sell. These margins will be shown once the quote is generated. For example, this is what it's going to cost to do the project, and this is how much you're projected to make based off of the quote and the margins built into your product price book.
- Easily download, share, and keep track of all the quotes that you are generating with AI inside of your different projects.

2. Scope definition

-In Scope:

- Sidebar that gives you access to all your projects. Once you click on a project, it will pull up the chat history, workspace, and log for that specific project.
- A search tab allows you to filter and search through all your different projects based off just typing in the project name or specific details about the project. (Housed within side bar)
- A price book tab that allows you to: add new products, search existing products, upload CSV files of product catalogs. This will be used when building your quotes and asking for certain material, line items, and all that. (Housed within side bar)
- Default home screen where you type in the name to create a new project and select what services and products are going to be used within the project. Then When you hit submit, it will automatically Add that new project to the projects section And open up a new project chat.
- A project chat window that is similar to a ChatGPT And when a project is first created, it will ask you to enter your scope of work. There will be three key sections within this chat window, which will look like how Cursor Terminal is set up. Part one is the chat window

where you are prompting your quote based off of the scope of work. Part two is a workspace section where you can upload your work docs and images that will be used to quote and build your estimate. Part three is a quote log section that will house all of the versions of your quote that you push to production Where you could then go back and access to either download or revise.

- A PDF downloadable quote that lists things like: Product number, Product name, List price, Discount to customer, Quantity, Total price, Taxes, Shipping and handling, Final price of the project. In this PDF, the company could add their logo to it will have their address as well. But this is what gets created when they finish up a quote and this side is good.
- Login and sign-in credentials for people to be able to create an account to access features and services of the platform. A company will be able to add licenses to their account; Which means teams or multiple team members could collaborate within the company account.
- Pricing page so that Users can purchase from website, with credit or debit card or PayPal, so I have to be able to collect those payment via something like Stripe.
- Onboarding new users once purchased, so they could create an account and be on boarded to the platform.
- Front-end landing page style website with information about the software and our services and problems we're solving along with pricing. It just serves as a front-facing website where if a user decides to move forward, they could purchase a seat. For those who have already purchased a seat, they could log in to their account.

-Out of Scope:

- App version of this SaaS platform.
- Dashboard with analytics and data when it comes to things like: Quotes created, Quotes sent out, Quotes approved, Date filters, Revenue Filters, etc.
- Being able to create full proposals where clients could sign, date, and accept formal proposals.
- Building out different pages like a services page, product features, blog section for that front-end website.
- **Integration:** Quote/Estimates sync with CRM, project management, or accounting systems (e.g., Salesforce, PandaDoc, QuickBooks).

3. Target market and user analysis

-Total Addressable Market (TAM)

- A blue-Collar Industry brick and mortar service-based business doing between \$2M+ in annual revenue: general contractors, electricians, plumbers, HVAC companies, roofers, painters, flooring installers, drywall and stucco contractors, masonry and concrete specialists, tile and stone installers, handymen, carpentry shops, fencing contractors, pool builders, asphalt or paving companies, landscaping companies, security system installers, garage door companies, low-voltage and structured cabling companies, telecommunications installers, internet and fiber contractors, alarm monitoring providers, audio-visual and home theater installers, fire alarm.
- 500k + companies and 3 million + employees

-Technology Profile

- They probably use tools like ServiceTitan, QuickBooks, Jobber, CompanyCam, System Surveyor, and have some kind of project management and CRM tool.

-Ideal Customer Profile:

Tier	Buyer Type	Primary Goals	Example Titles
1 End Users	Build quotes daily	Speed & accuracy	Estimators, Engineers
2 Mid-Level Managers	Oversee quoting teams	Standardization, visibility	Estimating Manager, Ops Manager
3 Executives	Approve software	Profitability & growth	COO, VP Ops, CEO
4 Influencers	Support adoption	Integration, usability	IT Manager, Project Manager

1. Estimating & Engineering Department

These are the heaviest users and most immediate beneficiaries of an AI estimating platform.

Primary Titles:

- Estimator / Senior Estimator
- Lead Estimator
- Preconstruction Estimator

- Design Engineer / Systems Engineer
- Project Engineer
- Electrical Engineer (in design-build firms)
- Low Voltage Engineer
- CAD Drafter / Designer

2. Project Management & Coordination

Once a project is awarded, these roles struggle when the handoff from estimating is messy or inconsistent.

Primary Titles:

- Project Coordinator
- Project Manager
- Assistant Project Manager
- Operations Coordinator
- Construction Administrator
- Project Controls Specialist

3. Operations & Leadership (Decision-Makers)

These are the people who approve the purchase of your AI quoting system. They don't build estimates — they feel the downstream pain of inefficiency and lost bids.

Primary Titles:

- Operations Manager / Director of Operations
- VP of Operations
- COO
- General Manager
- Construction Manager

- Director of Preconstruction
- Estimating Manager / Head of Estimating
- VP of Estimating
- CEO / Owner (especially in mid-size firms)

4. Sales, Business Development, and Account Executives

In low-voltage and commercial security firms, these roles often generate and send quotes themselves (especially in smaller companies).

Primary Titles:

- Account Executive / Sales Engineer
- Business Development Manager
- Inside Sales Rep
- Territory Sales Manager
- Solutions Consultant

5. Company-Level ICP Segments

These roles exist within certain company profiles — your highest-probability customers fall into these buckets:

- **Low Voltage Integrators** (security, access control, AV, cabling)
- **Electrical Contractors** (commercial, industrial, mixed-use)
- **General Contractors** (with internal estimating teams)
- **MEP Contractors** (Mechanical, Electrical, Plumbing)
- **Specialty Trades** (HVAC, roofing, solar, etc.)
- **Design-Build Firms**
- **Facilities or Security Integrators** handling recurring bids for clients

-Pain Points

1. Data & Information Gathering Pain Points

- **Scattered project data:** Material lists, labor rates, and past project details live in emails, PDFs, and spreadsheets instead of a centralized system.
- **No version control:** Estimators constantly overwrite old versions or lose track of the latest file revisions.
- **Manual takeoffs:** Engineers waste hours counting symbols and devices on drawings instead of using AI-powered detection or import tools.
- **Difficulty reusing past work:** No quick way to reference prior jobs, pricing, or templates, leading to repetitive rebuilding of similar estimates.

2. Time & Workflow Efficiency Pain Points

- **Estimates take too long:** What could be automated in seconds often takes hours or days of manual entry and formatting.
- **Repetitive tasks:** Copy-pasting line items, re-calculating margins, or re-formatting proposals consumes valuable time.
- **No automation:** Labor hours, markups, or tax calculations all require manual math and double-checking.
- **Administrative bottlenecks:** Engineers and coordinators spend more time building documents than actually engineering or managing projects.
- **Missed bid deadlines:** When multiple RFPs hit at once, manual quoting makes it impossible to submit all bids on time.

3. Accuracy & Cost Control Pain Points

- **Human error:** Manual entry leads to typos, wrong quantities, or missing line items that can cost thousands.
- **Inconsistent pricing:** Each estimator uses their own spreadsheet formulas, so margins and rates vary by person.
- **Untracked revisions:** When pricing changes mid-project, there's no clear record of who adjusted what and why.

- **Difficulty managing change orders:** Adjusting an existing quote or adding new scope requires rebuilding sections manually.
- **No validation:** There's no built-in check to flag missing parts, mismatched units, or unrealistic labor estimates.
- **Difficult client communication:** Making quick revisions for a client's request means digging through old documents and re-exporting everything.

5. Knowledge Management Pain Points

- **No institutional memory:** When a senior estimator leaves, all pricing logic and experience leave with them.
- **Tribal knowledge problem:** Key assumptions live in someone's head instead of a centralized, searchable database.
- **Hard to train new estimators:** New hires struggle to learn inconsistent or undocumented workflows.

6. Customer Experience & Professionalism Pain Points

- **Slow turnaround times:** Clients expect same-day or next-day proposals, but manual methods can take several days.
- **Inflexibility:** Making scope changes or offering optional alternates requires a complete rework.
- **Lost opportunities:** When quotes take too long or contain errors, customers go with faster competitors.

7. Business Operations & Growth Pain Points

- **Inability to scale:** Manual workflows can't keep up as quote volume grows.
- **No integration:** Estimates don't sync with CRM, project management, or accounting systems (e.g., Salesforce, PandaDoc, QuickBooks).
- **Poor forecasting:** Leadership lacks visibility into pipeline value or estimated backlog.
- **Reactive pricing:** No insights into profitability until after projects are complete.
- **Limited bandwidth:** Engineers get bogged down in admin work instead of high-value design or oversight tasks.

8. Competitive Disadvantage Pain Points

- **Slower response time than AI-enabled competitors:** Losing bids because others can quote faster with automated tools.
- **Higher labor cost:** Manual estimating eats up billable engineering hours.
- **No adaptive intelligence:** Traditional tools can't learn from past wins/losses to refine pricing strategies.

-Success Criteria:

1. Estimators, Engineers & Preconstruction Roles

These are your *power users* — the ones who live inside the tool daily.

Primary Success Criteria:

- **Quote speed improvement:** Can they build a complete, accurate quote **50–80% faster** than before (e.g., minutes instead of hours)?
- **Takeoff automation accuracy:** Does AI correctly detect 90%+ of symbols, devices, and materials on drawings or plans?
- **Template and data reuse:** Can they quickly duplicate past projects, apply saved templates, and auto-update materials and pricing?
- **Error reduction:** Fewer manual calculation mistakes or double entries compared to Excel-based workflows.
- **Ease of revision:** Can they instantly adjust line items, margins, or scope changes without rebuilding the entire estimate?
- **Export & presentation quality:** Do proposal outputs look clean, branded, and professional without manual formatting?
- **Confidence in AI suggestions:** AI recommendations (pricing, labor hours, part substitutions) must be explainable and editable, not “black box.”

What success feels like to them:

They finish bids early, trust their numbers, and no longer dread repetitive takeoffs or formatting — their work output doubles without burnout.

2. Project Managers & Coordinators

They depend on the **clarity and traceability** of quotes to manage execution.

Primary Success Criteria:

- **Clean handoffs:** Estimates seamlessly convert into scopes, budgets, or bills of materials for field execution.
- **Change order agility:** Updating a quote for revised scope takes minutes, not hours.
- **Centralized version control:** Everyone works off the same document, with a full audit trail of changes.
- **Cross-team visibility:** PMs can instantly view status of pending, approved, or lost quotes.
- **Integration with project systems:** Quotes sync automatically with Procore, Monday, Smartsheet, or Salesforce.
- **Communication clarity:** AI-generated summaries make it easy to share client-facing or internal updates.

What success feels like to them:

No lost revisions, no confusion about latest numbers, and zero surprises between estimating and field operations.

3. Operations Leaders & Executives (Decision-Makers)

These are the **economic buyers** — they care about scalability, margins, and predictability.

Primary Success Criteria:

- **Bid-to-win ratio increase:** AI insights help prioritize and tailor bids, improving win rates by 10–30%.
- **Standardization:** All quotes use consistent cost structures, markups, and presentation templates across teams.
- **Profit margin visibility:** Real-time dashboards show projected gross margin per job before sending quotes.
- **Labor efficiency:** Fewer estimators handle more bids (2–3× throughput) without additional headcount.
- **Forecast accuracy:** AI data feeds improve pipeline predictability and revenue projections.

- **Reduced rework:** Minimal revisions from clients due to clearer proposals.
- **Faster sales cycles:** Shorter time from RFP to signed proposal (measurable in days saved).

What success feels like to them:

They can scale quote volume, tighten margins, and trust forecasting without hiring more people or micromanaging the team.

 4. Sales & Account Executives

These users rely on quotes as **sales tools**, not just technical documents.

Primary Success Criteria:

- **Speed to proposal:** Ability to create a client-ready proposal same-day after a discovery call.
- **Quote flexibility:** Easy to add options, alternates, or “good / better / best” packages.
- **Visual presentation:** Branded proposals that impress clients and clearly communicate value.
- **Live pricing confidence:** Always-accurate cost data for instant quoting on calls.
- **CRM sync:** Quotes auto-attach to deals in Salesforce, HubSpot, or GHL.
- **Follow-up automation:** AI reminders for when a quote is viewed or needs revisiting.

What success feels like to them:

They close faster, follow up smarter, and never lose a deal because the proposal took too long.

 5. Finance, Admin, and IT Stakeholders

They care about **data integrity, compliance, and integration** across the tech stack.

Primary Success Criteria:

- **Accurate cost coding:** Estimates align with accounting categories for smooth billing.
- **Automated data flow:** No double entry between estimating and QuickBooks/ERP.
- **Approval control:** Multi-level approvals for discounts or margin changes.

- **Audit trail:** Traceability for every quote version and approval step.
- **System reliability & security:** Cloud-based, backed up, and compliant with IT standards.

7. Industry-Specific Success Criteria

Low-Voltage / Security Integrators:

- Automatically map devices from drawings (cameras, access points, panels).
- Generate wiring diagrams, cable lengths, and cost breakdowns instantly.
- Deliver branded proposals with camera layouts, specs, and warranty details.

HVAC / Electrical / Plumbing:

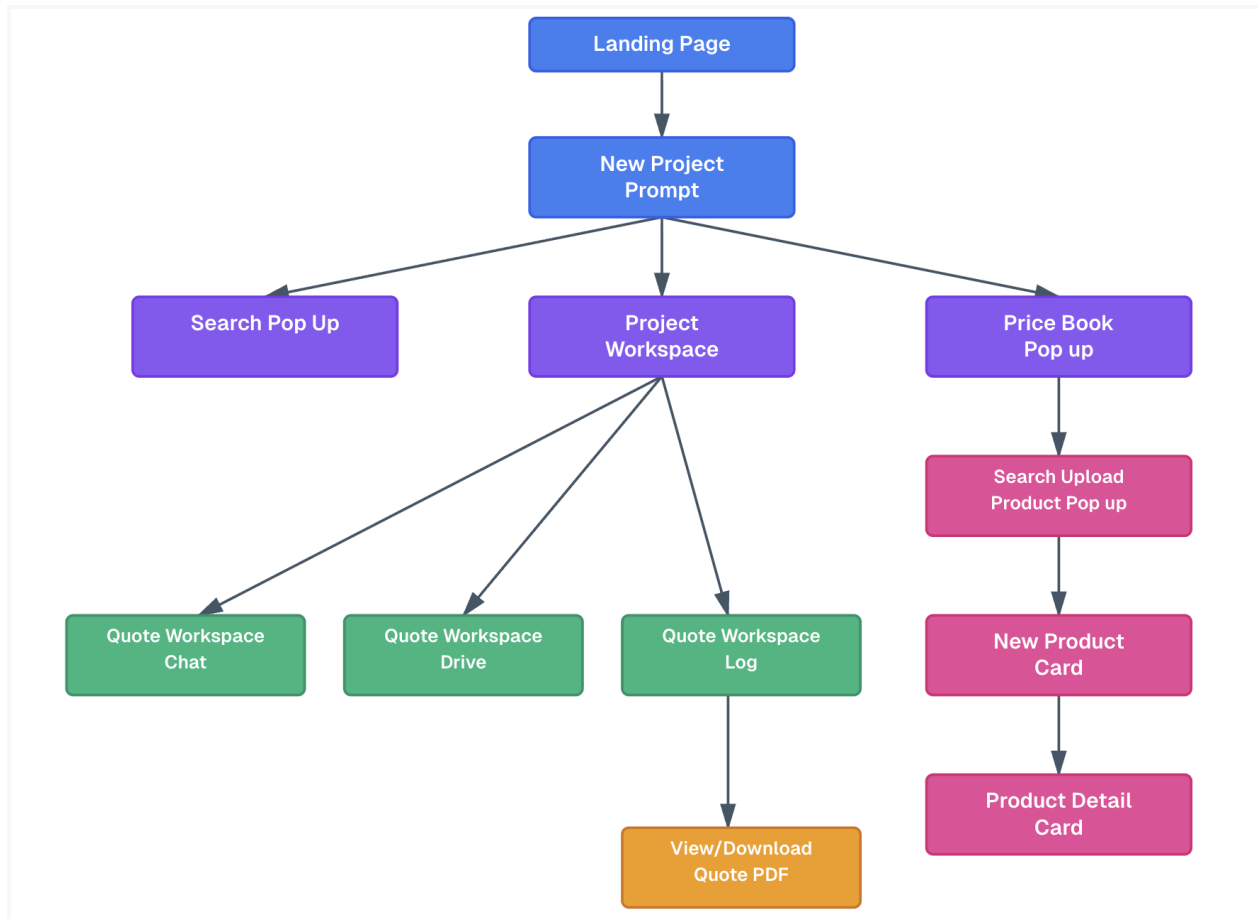

- Accurately calculate labor hours, materials, and unit pricing from standard assemblies.
- Adjust costs dynamically for regional labor rates or supplier updates.
- Link estimates directly to service maintenance contracts.

General Contractors:

- Aggregate and standardize subcontractor bids using AI normalization.
- Automatically compare vendor quotes and detect outliers.
- Roll up project summaries for executive approval.

4. Wireframes

-Webapp Hierarchy

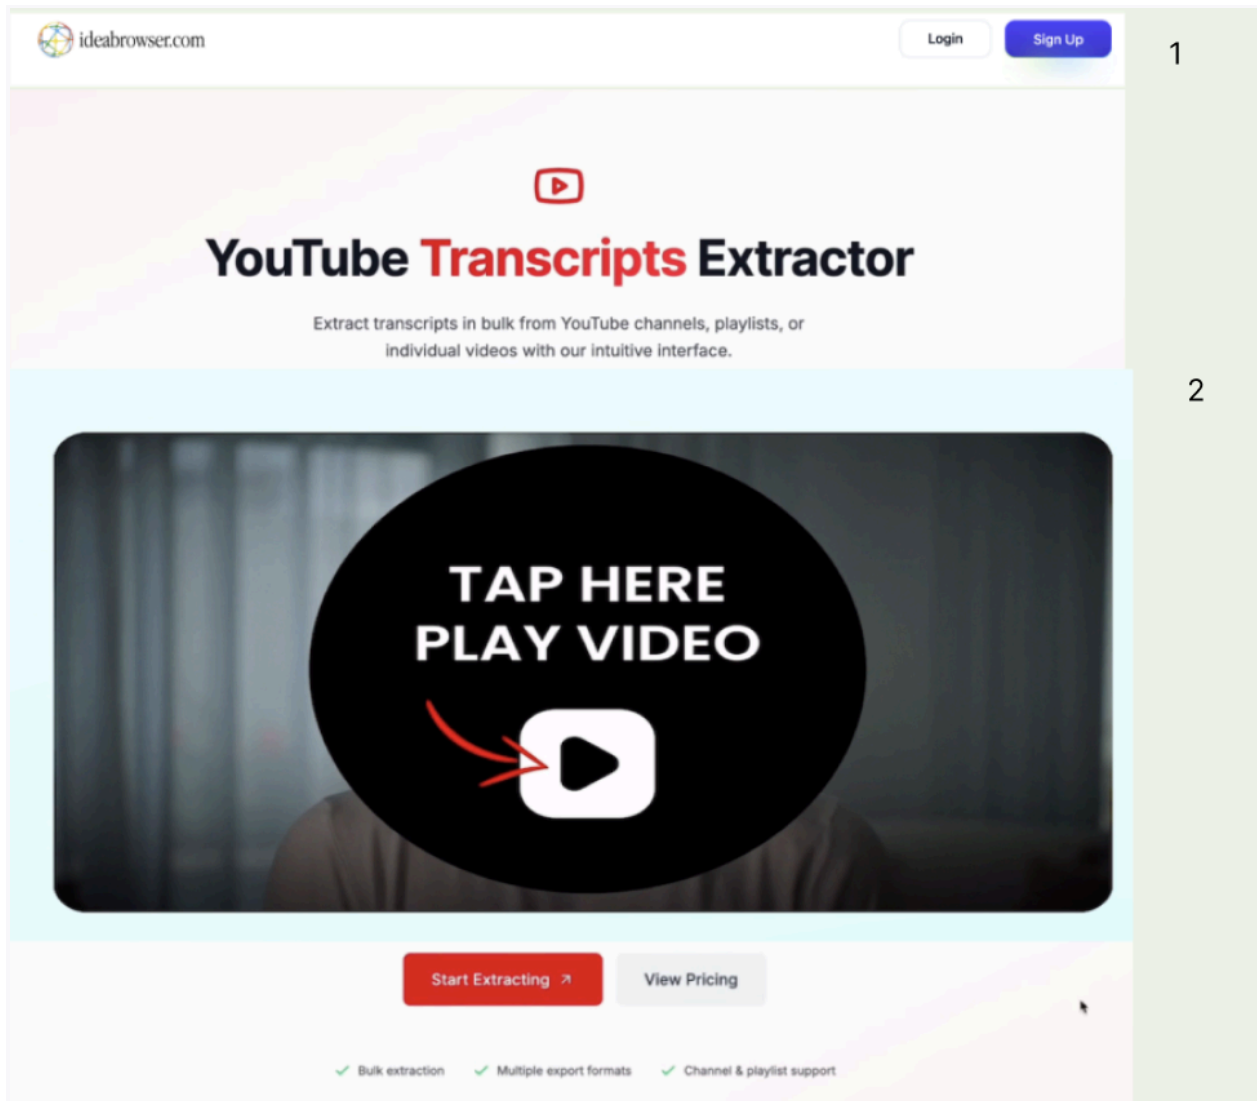

-Detailed user/feature flow and requirements

(Screen shot of wireframe and detailed breakdown of the user/feature flow on that specific page. Also upload your logo file and design instructions.)

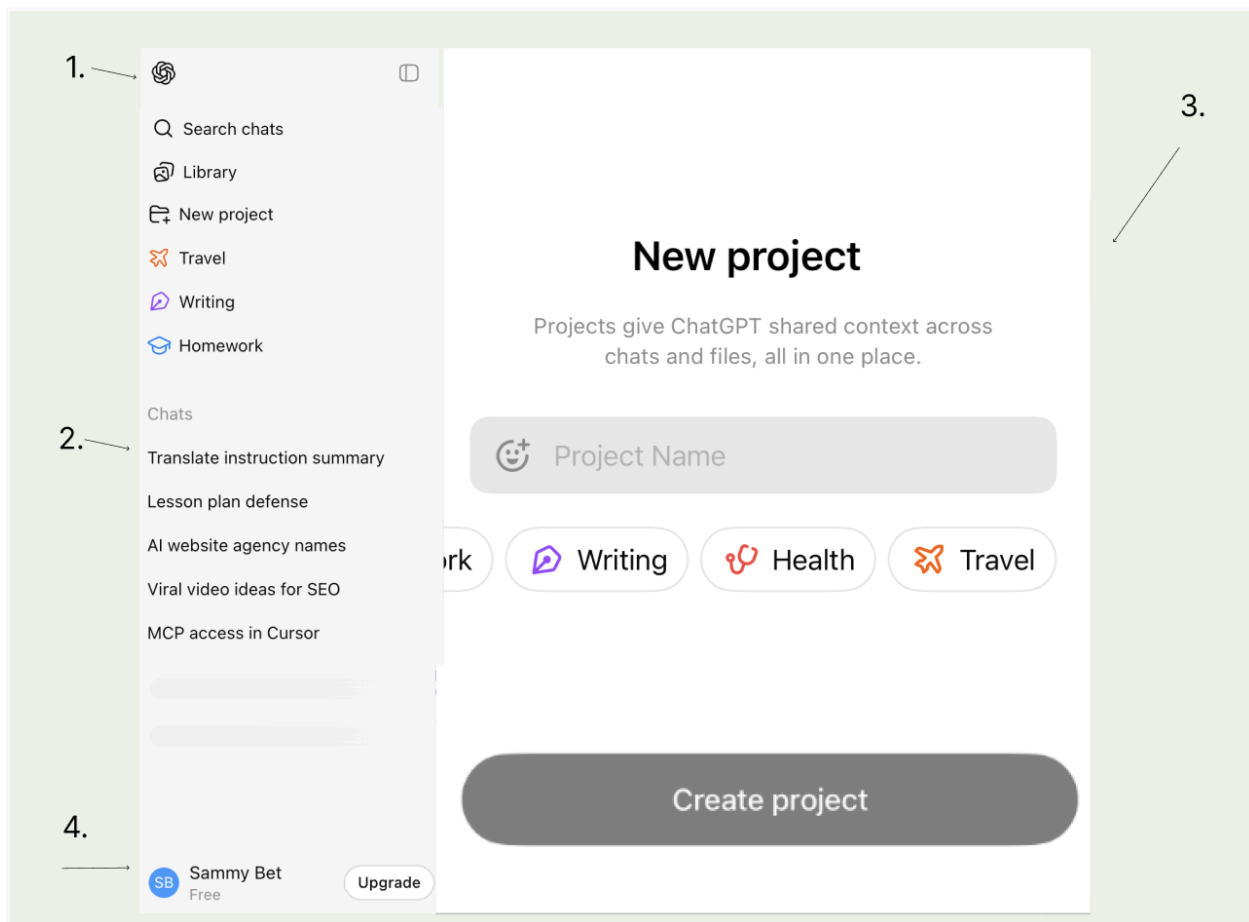

Landing Page

1. Section one is just going to be the header with the logo and name of the website at the far left, and at the far right, there will be a login and sign up button. When a user clicks "Login," it will take them to a login page. When it goes to a sign up, it will take them to an email pop up and then from there to the "Book a Demo" page
2. Section 2 will be the hero Section. Contextualize this to our app. There will be a video sales letter, and then the two buttons are going to be: 1. See demo 2. Book demo. In user clicks "See Demo," pop up a video demo. If they click "Book Demo," pop up a lead capture form.

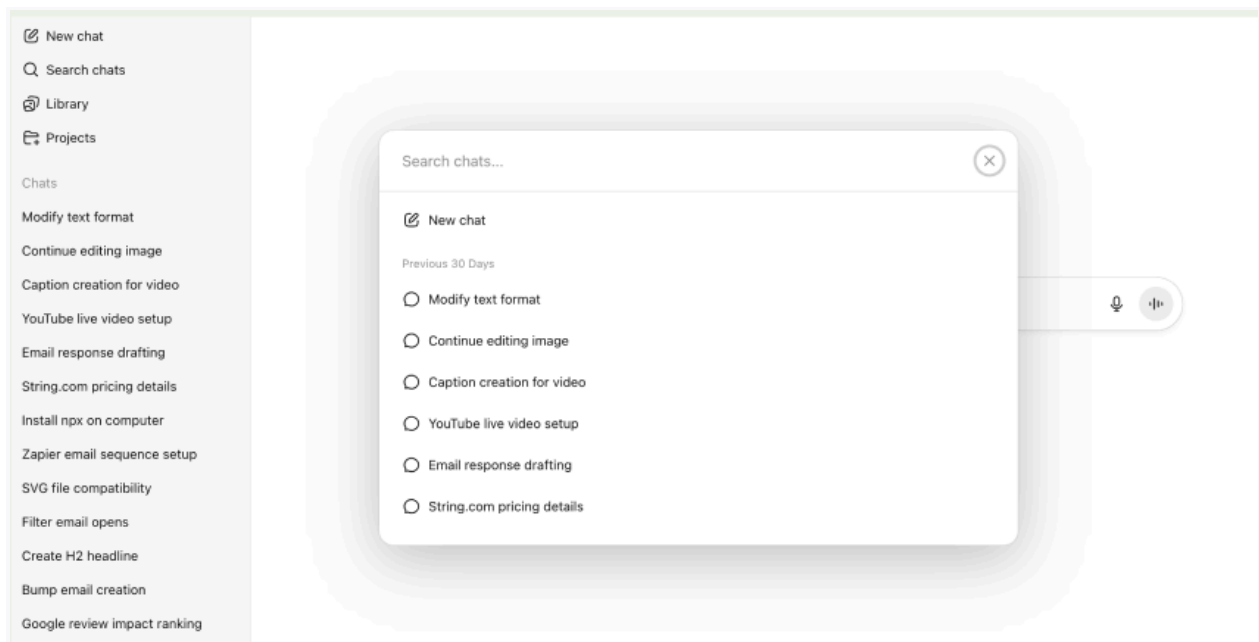

New project prompt- The new project prompt is essentially the home screen when somebody logs into the app. This is where they're able to create a new project. You'll see that it has a sidebar to the left that you can toggle To show or not to show And on the right is a chat screen that gives them the ability to create a new project:

1. Section one is the sidebar you'll see at the top left will be our company logo. To the right of that is the toggle button. Below that where it says "Search Chats" instead that's going to be used to search through our different projects. Where it says "Library" instead, it's going to be "Price Book". So that's what will pop up our price book. Where it says "New Project", that will essentially direct users back to this home screen. Go ahead and ignore the travel writing and homework icons
2. Section 2 instead of it saying "chats", it's going to say "projects". That's going to list all the project names and essentially be the workspaces that people could click and access the quotes for those projects they're working on.
3. Section 3. This is the main chat interface when creating a new project. Where it says "project name," that's where they'll enter the project name. None of the buttons become clickable until they type in a project name. Once they type in the project name, they can select what is within the scope of work within that project. That way it lets you know which product family to be searching through the price book when creating the quote. And then let's say they click on "Writing" and "Travel," those two buttons will be highlighted, and as soon as they press any of those product family buttons, the "Create Project" button will become clickable. They could just click "Create Project" once they're done, it will create and open up a new workspace that gets added to that workspace column at the left sidebar.
4. Section 4 - that is essentially their user profile, where they could access their login, payment, and settings, and all that.

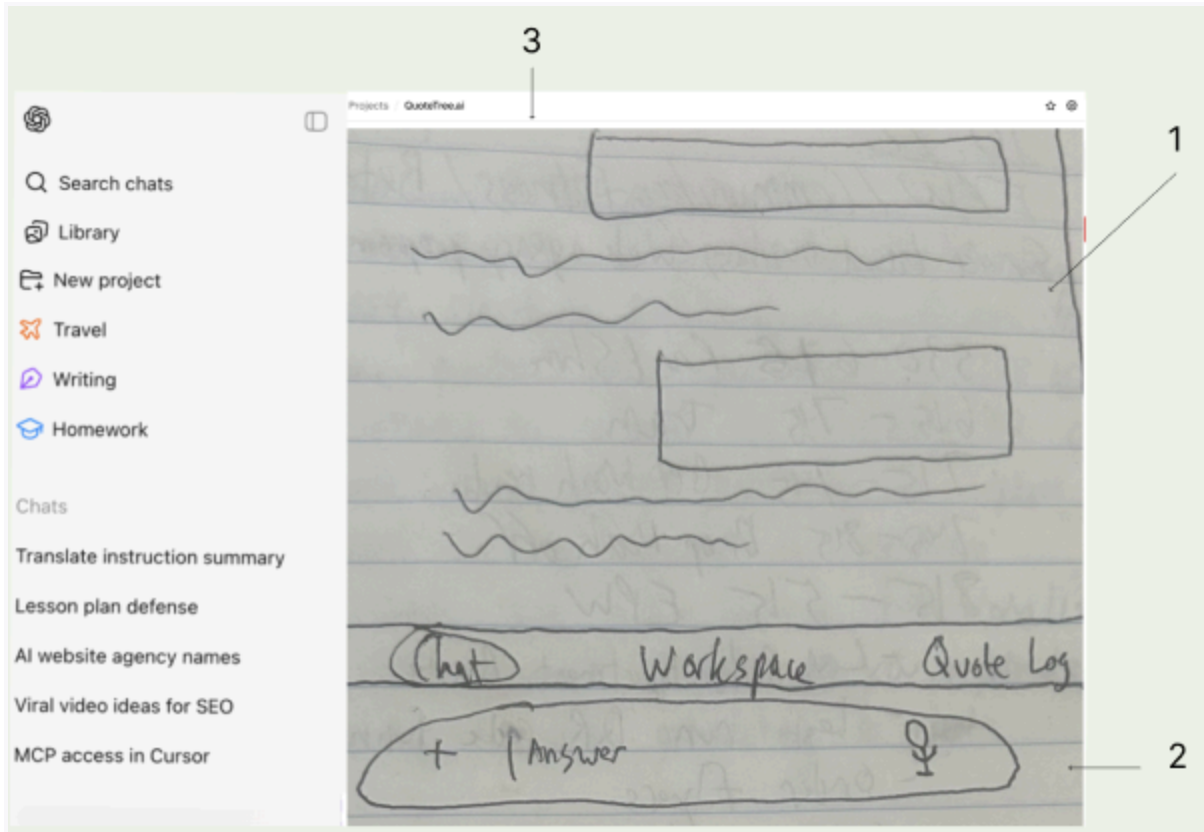

Search pop-up: Essentially, when a user clicks on the search chats, it will bring up a pop-up like this that they can just type in keywords associated with a project and it will filter through their projects. They can easily just click on it and it'll take them to that project. Where it says "New Chat," you can go ahead and make that new project. If someone clicks "New Project," it'll take them to that new project prompt page.

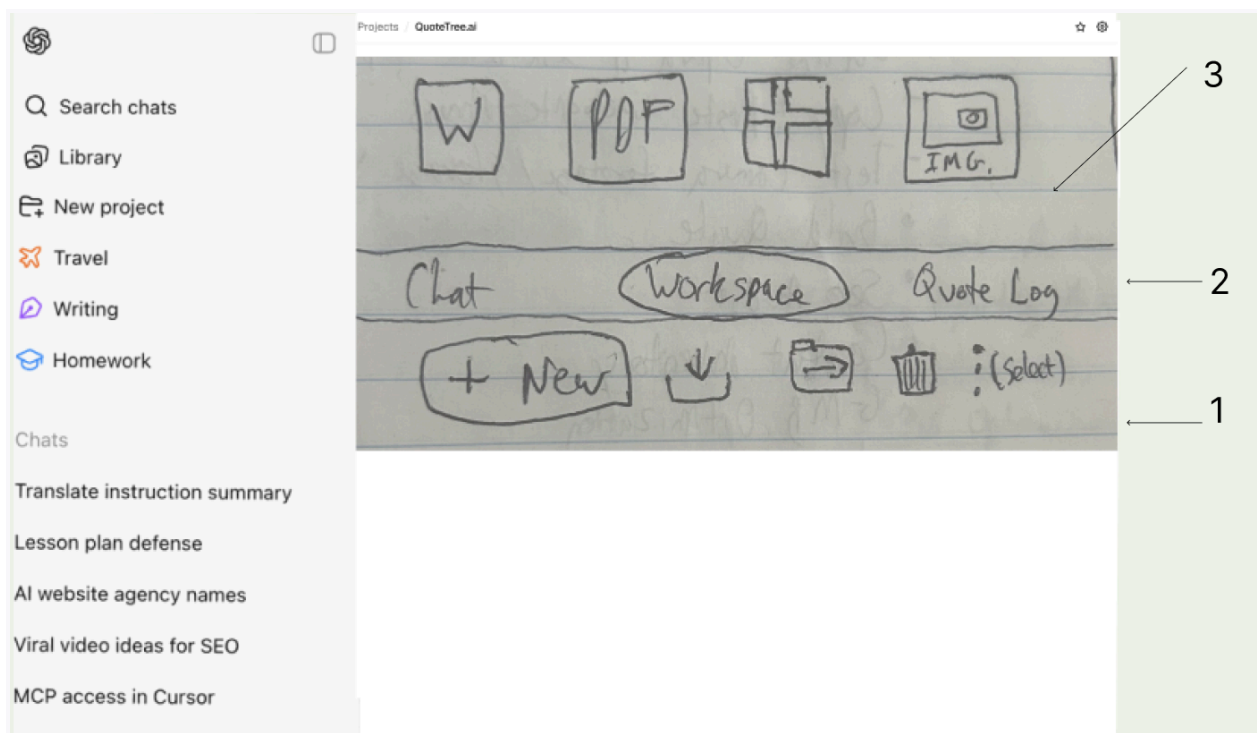

Project Workspace / Quote Workspace chat: If you look at the flow chart, you'll notice that when someone So, clicks on a project workspace or creates a new project workspace, it takes them to a project workspace page. That essentially is the same page as the quote workspace chat. So anytime I refer to "project workspace" or "workspace chat," I'm referring to this layout structure and functionality here. So essentially a project workspace is going to have three different sections inside of that search bar tab. Chat Drive Log But for the purposes of this wireframe right now, we're just going to discuss the functionality of the quoteworkspace chat.

1. Okay, this is arguably the most important functionality of the whole app. This is going to make it possible for that conversational AI to feel so let's say someone starts a new project in this chat. The first question will be from chat asking for the scope of work. The user will then type in the scope of work, and boom! Before you give it a quote, you're going to ask a couple of clarifying questions based on things you know that might be missing from their description to give you a better understanding of how to build that quote. Right? Something that will help making your recommendations will be our price book. Every product in the price book is going to have A short, two- to three-sentence description A product tag and a product type. This gives the AI better context of what clarifying questions to ask, such as: What type of equipment do you need? What's the brand you might need? Things you know that are necessary to quote it properly. Once you feel like you have everything you need to generate a quote, you will ask the user for permission to generate that quote. Once permission is granted, you will generate the quote. After you generate the quote, You'll display the quote within the chat and ask the user if it looks ready to submit to the quote log. This allows a user to a- review The quote and approve of your work, and then have it saved inside of their quote log to be able to go download or reference. B. If the user finds that you are missing something or did anything wrong, it could continue the chat with you to make the changes that it needs and then ask you to generate the quote again. You'll go through the same process, displaying the quote within the chat, asking if it looks ready to submit to the quote log. One other thing to keep note of is that when a user Clicks to edit an existing quote within that quote log. It will be pulled up inside of the chat where you'll pick up where you left off and follow any further instructions when editing that quote. For the most part, it would just be a chronological chat history. This is essentially the only thing that will be happening on this page.
2. This is the area where a user will input their questions and answers and also have the ability to access their mic so that they could do a speech-to-text.
3. This will be kind of like a breadcrumb bar that is displayed at the very top when a user clicks on a new or existing project. It'll just be "project/the project name" and then, at the far right, the little settings button will be there. Don't include that little star button. And essentially, just the settings button is just to be there if they want to delete the project or not.

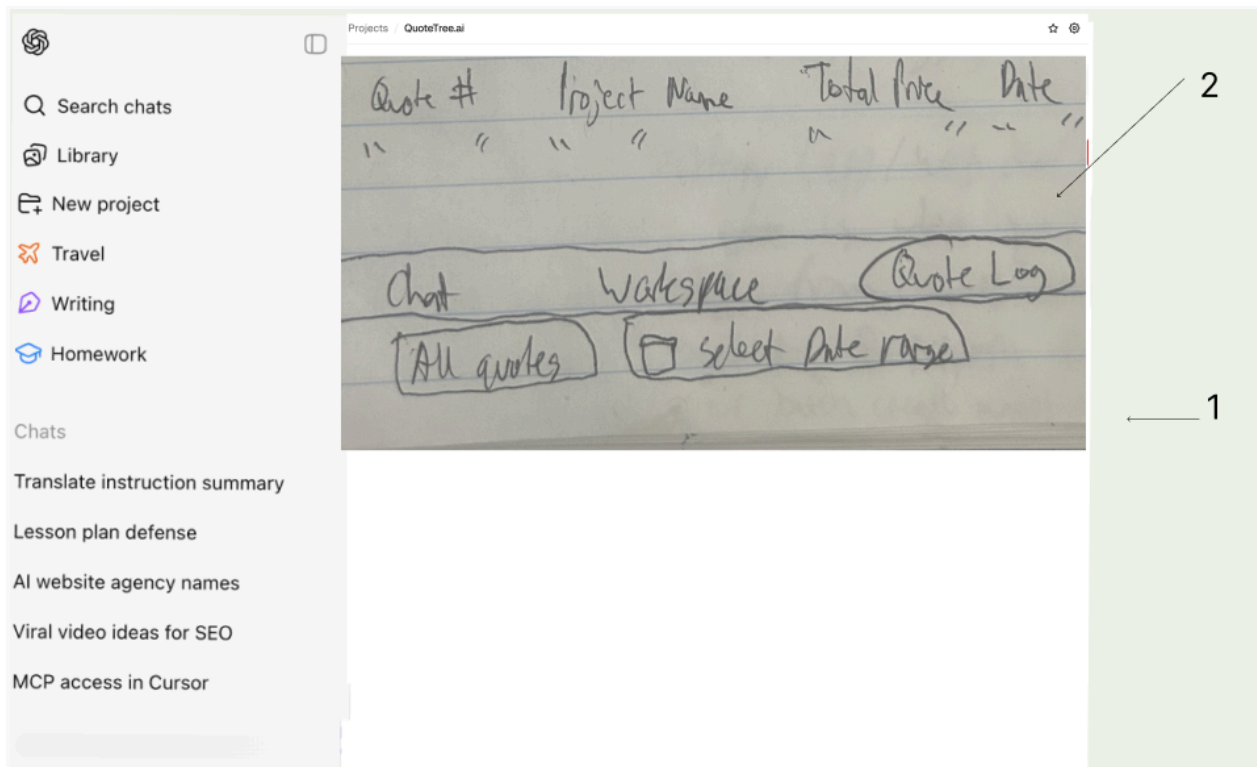

Quote Workspace Drive: This is essentially like a Google Drive for each individual project where the estimator or engineer could add any relative docs. Images, spreadsheets, related to the project that they're quoting.

1. Here they'll be able to add new docs, download files, delete files, select files, all that.
2. This is essentially a feature of our chat bar that has three different sections, kind of similar to how the cursor terminal is Designed. This allows a user to easily navigate between the chat space, workspace, and log within their project workspace.
3. This is where the documents and stuff that they upload will live, and they can access and open.

Quote Workspace Log: When a user commits a quote (meaning that it's finalized), this is where that quote will get added for them to go and access it. It has that GitHub feel when you're working on a certain part of the website and you say, "Okay, let's merge it to the final branch." This is where the final version of each quote will live. From here, a user could navigate all the different versions that they committed. They could pick up where they left off editing that quote. From here, they'll be able to see the history of the different versions of the quote and they could download the quote from here as well.

1. For Section 1, please replace the "all quotes" button with "add new quote" button. This "Add new quote" button will essentially allow users to add an additional quote, starting a fresh new quote within that same project workspace.
2. This is essentially a log of all the inputted quotes. Alright, it has the quote number, quote name, the total price of the quote. I also want a section that shows the profit margin of the quote, the date that the quote was created, and also a status section where they could update the statuses of that quote. The three different statuses are: 1. Approved 2. For approval. 3. Draft 4. Declined. (Eventually, this will notify any manager or owner that the status of the quote has changed, and they can go and review it.). Project name is clickable link that opens up quote

View/Download Quote PDF: Any time a new quote is generated from the chat or is added to the quote log, this is the format of how the quote will be generated And how it will look when downloaded as a PDF.

1. At the top left, the company logo will be displayed. Underneath that will be the company address, and at the far right will be the quote number as well as and expiration date That is set 3 months In the future, when the "quote" was generated.
2. Here is where the products will be listed in the quote, as well as the overall price of the final quote. Instead of shipping and handling, it will say taxes instead. Use these same columns in the photo below.

406 E 3rd Ave
San Mateo, CA 94401

Quote Number : DP25-CB8V-YS9X-WVU4

Expiration Date : 10/31/2025

Model	Description	List Price	Discount (%)	Unit Price	Quantity	Total Price
CD53-256-HW	CD53 Indoor Dome Camera, 256GB, 30 Days Max	\$1,199.00	30	\$839.30	6	\$5,035.80
CD53-256E-HW	CD53-E Outdoor Dome Camera, 256GB, 30 Days Max	\$1,399.00	30	\$979.30	15	\$14,689.50
LIC-CAM-5Y-CAP	5-Year Camera License, Capacity Increase	\$899.00	30	\$629.30	21	\$13,215.30

Total Price \$32,940.60

Shipping & Handling \$357.00

Grand Total \$33,297.60

Price Book Pop-up /Search upload product pop-up.: This pop-up will display when the user hits the Price Book tab in the navigation bar. Here they'll be able to: Create a new product, View their products, Bulk load existing products.

1. This is the Search Filter section where they can search through their different products by typing in a keyword. And then that 'x' button is there for them to close out the pop-up window
2. In this section, if they click "New Product," it will just take up to the "New Product Upload" section of this popup, but it will keep the popup open. They can also upload a CSV, and the CSV automatically will bulk upload products into their price book. As far as the CSV uploading is concerned, it will be Column Mappings where each column below must be mapped to the related field in our quote tree pricebook (which are Product Name, Product Family, List Price, Sales Price, Product Description). When possible, we will automatically detect and map related fields for user. For any that we're unable to map, we can have user select the field that most accurately describes the type of data they're importing. This will ensure the information in their records are updated accurately.
3. Here will be where the products are displayed. You can see the product name, product type, description, family, and all that. If they click on the blue link, it'll take them to the individual product. That little arrow section allows them to delete a product or edit a product.

The screenshot displays a product management interface. On the left is a sidebar with navigation options: New chat, Search chats, Library, Projects, Chats, Modify text format, Continue editing image, Caption creation for video, YouTube live video setup, Email response drafting, String.com pricing details, Install npx on computer, Zapier email sequence setup, SVG file compatibility, Filter email opens, Create H2 headline, Bump email creation, and Google review impact ranking. The main area features a 'Search chats...' input field with a close button (X). Below this are two buttons: 'New Product' and 'Upload CSV'. A table of products is displayed below the buttons, with columns for Product Name, Product Code, Product Description, and Product Family. The table contains 14 rows of product data. Numbered callouts are present: '1' points to the search bar, '2' points to the 'New Product' and 'Upload CSV' buttons, and '3' points to the product table.

New product card: When a user clicks to edit a product or add a new product, this is what is displayed. It allows them to change the different fields associated with that product when it comes to name, pricing, description, and all that.

1. Here, a user can start to fill out the information regarding the product they want to add to their price book.
2. Once they're done writing out, they can either save as new, save edits made to an existing product, or cancel Edits are uploading. Get out of that popup..

The screenshot shows a 'New Product' form within a software interface. On the left is a sidebar with various tools and options. The main form is titled 'New Product' and includes a legend indicating that an asterisk (*) denotes required information. The form is divided into sections: 'Product Information' and 'Product Family'. The 'Product Information' section contains fields for 'Product Name' (with a red border and a 'Complete this field.' error message), 'Product Code', 'Cost', 'Sales Price', and 'Product Description'. The 'Product Family' section includes a dropdown menu currently set to 'Access Control' and an 'Active' checkbox. At the bottom of the form are three buttons: 'Cancel', 'Save & New', and 'Save'. Two callout lines, labeled '1' and '2', point to the 'Save & New' and 'Save' buttons respectively. The sidebar on the left lists various features such as 'New chat', 'Search chats', 'Library', 'Projects', 'Chats', 'Modify text format', 'Continue editing image', 'Caption creation for video', 'YouTube live video setup', 'Email response drafting', 'String.com pricing details', 'Install npx on computer', 'Zapier email sequence setup', 'SVG file compatibility', 'Filter email opens', 'Create H2 headline', and 'Bump email creation'.

Product detail card: This is essentially a card where if a user searches for a product within the price book, and they want to click in on the details of that product, this is the card that will be displayed. From here, they could just see the details of that product, and if they want to go ahead and make any edits, they can. Which will then take them back to that new product card layout to edit and save new changes..

5. Technical Architecture & Stack

(Technology stack you'll be working out of along with any suggestions that cursor development tool would need to build out our webapp based on our requirements.)

Frontend: React + Vercel

Backend: Supabase (Database, Auth, Storage, Events)

AI Layer: OpenAI GPT-5 via API

Orchestration: LangChain or Vercel AI SDK

Database: PostgreSQL + pgvector for embeddings

Payments: Stripe

Hosting: Vercel

Version Control: GitHub

Analytics: Supabase event tracking (no Google Analytics)

Webhooks: Future integration placeholders for QuickBooks, Salesforce, etc.

6. Detailed Task Breakdown & Planning

(Duration and timeline of core features and key deliverables for a successful completion of MVP.)

MVP Development Roadmap

Sprint 1: Core Setup & Authentication

Sprint 2: Project Creation & Sidebar Navigation

Sprint 3: Price Book CRUD & CSV Upload

Sprint 4: Quote Generation, AI Chat & Log System

Sprint 5: QA, Analytics & Deployment

7. AI Context & Guardrails Layer

 **Goal: Prevent hallucinations and maintain quote integrity tied to Price Book + Project context.**

A. Intelligence Modes (Toggle per Project)

1. **Strict (RAG-Only):** Only use retrieved items from Price Book/project files.
2. **Hybrid (RAG-First):** Use retrieved items; allow generative suggestions if user approves.

B. Clarifying-Question Templates

- “Which brand or equivalent?” [Brand A] [Brand B] [No preference]
- “How many cameras per floor?”
- “Include labor?” [Yes/No/Separate line]

C. Safe Fallback – Draft Quote Preview

- Display non-committable draft with missing fields highlighted.
- Commit to Log once validated.

D. AI Context Memory

- Persist frequently used product families, markup rules, and templates per user.
- Recall project-specific preferences (e.g., tax %, default materials).

E. Auth & Analytics

- Supabase Auth for user + license management.
- Supabase Events for quote metrics and system telemetry.

F. AI Integration Details

- Provider: OpenAI GPT-5
- Prompt management: LangChain / Vercel AI SDK
- Vector retrieval: pgvector (Supabase)
- Deterministic math enforcement (tax %, discounts, margins auditable in Quote Log)
-
